

CROSS-SECTION OF A MEANDER

Match the feature/process to the correct definition. Add the number of the arrow alongside each feature / process.

	Deep water	A gently sloping area of land on the inside of a meander
	Slip off slope	Formed on the outside bend of the meander due to erosion.
	River cliff	Because of the gentle slope, there is a lot of frictional drag and so therefore the river flows at this speed
	Fastest flow	Maximum depth of the channel. (Note the asymmetrical cross-profile)
	Slowest flow	There is little frictional drag from the bed and bank at this point and so the river can flow at this speed.
